Abstract:
The present study focuses on the attitude of using social media for education purposes in Purulia district, West Bengal. The study conducted with the 300 higher level students in Purulia district, WB with the help of a self made questionnaire comprising 46 items having Cronbach Alpha value 0.77. ANOVA and 't' critical ratio were calculated on the basis the data collected through the tools. Result revealed that no significant difference exist in attitude towards using social media with regards to sex, residence and level of study. However, significant relationship exists between attitude of using social media and time spent for the use of social media.

Key words: Social media, Attitude, ANOVA, ‘t’ test

INTRODUCTION
Communication technologies and social media, now-a -day are the rapidly growing concern among students to support their

¹ Corresponding author: birbalsaha@gmail.com
learning activities even in formal education (Conole, Laat, Dillon, and Darby, 2006; Gerlich, Browning & Westermann, 2010). Social media affects education, learning, learners, women empowerment (as well as daily life, relationships, and other aspects of our contemporary society at large (Siemens, 2008). It is a common concept which gained its position and popularity in our life as a recent consequence of Web 2.0 (Tiryakioglu, 2011). It has become more widespread through social interaction using Internet and Web based technologies. In other words, the concept of social media refers to platforms such as social networks, blogs, micro-blogs, and forums where self-generated contents of users are shared by the user like a publisher.

Knowledge of a student is not only dependent upon intelligence but also the information s/he adheres from various sources. Use of social media, while on one hand broadens scope of research, on the other hand may be proven to be too much time consuming and harmful. But primary concern is the real threat that social media sites may expose students to dangers such as cyber-bullying or sexual predators.

Use of social media created a new environment and change the ways on sharing information not just for educational settings for all individual and institutions (Mayfield, 2011). Even though the use of social media and networking has become a new trend, it has come as in the guise of one of the most significant communication tools among people.

**REVIEW OF LITERATURE**

Gender differences have been evident in the adoption and usage of technological advances throughout modern times (Horowitz & Mohun, 1998). Bimber (2000) cites significant gender differences in Internet access and use. About 50-percent of the "digital divide" between men and women on the Internet is fundamentally gender related. (Bimber, 2000). Hew & Wing
Rituparna Chatterjee, Bhim Chandra Mondal, Birbal Saha- Student Attitudes towards Using Social Media for Educational Purpose

(2012) conducted a study to see motives around use of Facebook. They found that participant students use Facebook mainly for entertainment purposes i.e. for non-educational purposes. In another study, Hew (2011) found that Facebook as yet has very little use of educational purposes.

Zaidieh (2012) studied social networking in education where he expressed his opinions on social media sites as positive and useful tools if educators have the ability to control to fit in requirements of knowledge.

Social media changed the idea of communication, collaboration and interaction with others. We live in a complex, interconnected, global and networked world where information and communication is easily accessible and can be accessed instantly (Curran & Chatel, 2013; Greenhouse & Gleason, 2012; Morris, 2012). As a result, how we prepare teachers should include multimodal, networked practices that are already an integral part of the daily life of our teacher candidates (Curran & Chatel, 2013). Through conversations via social media, individual teachers contribute by offering strategies, which work in their classrooms. These suggestions are rejected or confirmed by other members of the chat or other social media gathering. Sharing suggestions, which the pre-teacher can implement, contemplate, and evaluate, that are tried and true is invaluable. Stein & Prewett (2009) explain how social media effects on social studies education.

In view of the above the Researchers tries to investigate the attitude of higher level students in using social media in their studies.

OBJECTIVES OF THE STUDY

The objectives of the study are as follows:

1. To find out the attitudes of Under Graduate and Post Graduate students in using social media to their study in Purulia district.
2. To analyze the attitudes of male and female students in using social media to their study in Purulia district.

3. To compare the attitudes of rural students and urban students in using social media to their study in Purulia district.

4. To study the interaction effect among gender and residence and level of study in using social media.

5. To study the relationship between the attitudes of using Social Media and spent time

HYPOTHESES OF THE STUDY

H₀₁: There is no significant difference between the attitude of UG and PG students in using Social Media in the Purulia district.

H₀₂: There is no significant difference between the attitude of male and female students in using Social Media in Purulia district.

H₀₃: There is no significant difference between the attitude of rural and urban students in using Social Media in the Purulia district.

H₀₄: There is no significant first order interaction effect between gender and residence in using Social Media in the Purulia district.

H₀₅: There is no significant first order interaction effect between gender and level of study in using Social Media in the Purulia district.

H₀₆: There is no significant first order interaction effect between residence and level of study in using Social Media in the Purulia district.

H₀₇: There is no significant second order interaction effect among gender, residence and level of study in using Social Media in the Purulia district.
H_0: There is no significant relationship between the attitudes of using Social Media and spend time for the overall students

METHODOLOGY OF THE STUDY

Population
All the students of Under Graduate (UG) and Post Graduate (PG) students of Purulia district of West Bengal comprised the population of this study.

Sample and sampling
300 students at UG and PG level of Purulia district were taken as representative sample of the whole population. Stratified Random Sampling technique was followed for selecting the Colleges and University. The distribution of sample is as follows:

Table 1: Sample profile

<table>
<thead>
<tr>
<th></th>
<th>UG</th>
<th>PG</th>
<th>Total</th>
</tr>
</thead>
<tbody>
<tr>
<td>Male</td>
<td>47</td>
<td>88</td>

<td>71</td>
<td>165</td>
</tr>
<tr>
<td>Total</td>
<td>141</td>
<td>159</td>
<td>300</td>
</tr>
</tbody>
</table>

Tool development
An attitude scale (Likert type) was used for knowing the attitude of the students in using Social Media. Here, researchers prepared a self made questionnaire for this study. Total 46 questions present in the questionnaire. The scale was pre-tested with volunteer subjects prior to deployment in this study. The pre-test was used to check for any difficulties in comprehending the items, as well as the overall technicalities of the instrument. No substantial problems in wording or mechanics were recorded. An alpha = 0.77 was calculated, indicating the scale has strong internal reliability.
ANALYSIS AND INTERPRETATION

**Descriptive statistics**

Descriptive statistics help us to simply large amounts of data in a sensible way. Each descriptive statistics reduces lots of data into a simpler summary. Here we present our descriptive data (Table 2) in the form of Mean (M) and Standard Deviation (SD) along with ‘t’ critical ratio for attitude scores in using social media.

Table 2: Presenting descriptive statistics including ‘t’ critical ratio

<td>14.04</td>
</tr>
</tbody>
</table>

**Inferential statistics**

Inferential statistics plays a pivotal role in hypothesis testing where it is used to determine if a null hypothesis can be rejected or retained. For the present study we have constructed a two way (2 × 2× 2) factorial design for the analysis of different variables (Table 3). Table 2 presents the ‘t’ critical ratio which is also used to test different null hypotheses.

TESTING OF HYPOTHESES

Testing of $H_0^1$:  
From Table 3, F-ratio for level of study is found to be 1.508 which is not significant (df=1, 292). Moreover, Mean scores of students attitudes in using social media for UG and PG are 150.15 and 147.96 respectively. Calculated t – value is 1.26 between UG and PG students which is less then table value at 0.01 levels (Table 2). Thus, it is evident that, there is no significant difference between attitude of UG and PG students in using social media. Hence, null hypothesis $H_0^1$ is accepted.

Testing of $H_0^2$:  
F- ratio for gender is found to be 0.029 (Table 3) which is also not significant at df (1, 292). Table 2 indicates mean scores of students attitudes in using social media for male and female are 149.14 and 148.80 with SD 14.72 and 15.74 respectively.
Calculated t – value is 0.19 between male and female students which is less than table value at 0.01 levels. Thus, it is evident that, there is no significant difference between attitude of male and female students in using social media. Hence, null hypothesis $H_0^2$ is accepted.

**Testing of $H_0^3$:**
From Table 3, F-ratio for residence is found to be 0.050 which is not significant (df=1, 292). Moreover, Mean scores of students attitudes in using social media for rural and urban are 149.10 and 148.91 respectively. Calculated t – value is 0.11 between rural and urban student which is less than table value at 0.01 levels (Table 2). Thus, it is evident that there is no significant difference between attitude of rural and urban students in using social media. Hence, null hypothesis $H_0^3$ is accepted.

**Testing of $H_0^4$:**
Two independent variables interact if the effect of one of the variables differs depending on the level of the other variable. In this study, three independent variables namely gender, residence and level of study are considered. So we have to examine whether there is any interaction is present or not. From Table 3 it is notice that gender and residence does not interact (F = 0.024 at df 1, 292) with each other at 0.01 level of significance. In the light of above finding $H_0^4$ is accepted.

**Testing of $H_0^5$:**
The interaction between gender and level of study on the attitude towards using social media is not significant as revealed by F- value which is 2.92 (Table 3). So, $H_0^5$ is accepted.

**Testing of $H_0^6$:**
The interaction between residence and level of study on the attitude towards using social media is also not significant as
indicated by F- value which is 3.69 (Table 3). So, \( H_0^6 \) is accepted.

**Testing of \( H_0^7 \):**
The F-ration for 2\(^{nd}\) order interaction among gender, residence and level of study on the attitude towards using social media is found to be 0.330 which is also not significant at df = 1.292 (Table 3). So, \( H_0^7 \) is accepted.

**Testing of \( H_0^8 \):**
It is observed from Table 4 that coefficient of correlation between attitude towards using social media and spent time for all student is 0.377 which is higher than that of table value (\( r = 0.148 \) at 0.01 level, df = 300). So, it is significant at 0.01 level. From Table 4, it is also observed that attitude of using social media has a positive relationship for all the groups. In the light of the above finding, \( H_0^8 \) is rejected. Hence, there is a significant relationship exist between attitude towards using social media and time spent for the use social media.

**DISCUSSIONS**

From the findings it is observed that attitude of using social media does not depends on gender, residence where the student reside and level of study. Gefen and Straub (1997), Gerlich et. al. (2011) established that attitude of using social media does not depends on gender which supports the finding of our study. The reasons for this finding could be explained by the possibility that both male and female belongs to 18-25 age group who are main common users, are tech-savvy irrespective of their gender and residence as well as their level of study. They are also dominant users of social networks. As the attitude towards of using social media is found to be high so it is expected the students will spent more time on Facebook,
twitter, Whatsapp etc. The findings of our study also support this point.

CONCLUSION

Social networks have millions of users whose numbers increase rapidly. It has affected the modern society positively and has changed some of people's habits. Effective use of features and opportunities of social networks supports instructors' empowering of the educational process with active learning, creativity, problem-solving, cooperation, and multifaceted interactions as well as students' using and improving their academic performance, inquiry, and alternative thinking.

In the modern information age, information is the key to the success in every field and in a way it is crucial for students to be updated about every aspects of this era. In this research it was found that male students and the female students are not significantly different when it comes to using social media for their educational purposes. Also their attitude and time spent on these sites are moderately correlated to each other. Thus, the researchers hope that this study will help the teacher as well as the students to benefit more in educational purposes by using social media properly.
